

## 1.7 Explicit Sequences

An ordered list of terms;  
a function whose domain (input)  
is all natural #s.

$$\{1, 2, 3, \dots\}$$

term: each item in

$t_{\text{sub}1}$  sequence

$$t_1 \quad t_2 \quad t_3 \quad t_4 \quad \dots \quad t_n$$

Find next 2 terms:

a)  $1, 3, 6, 10, 15, \underline{21}, \underline{28}$   
 $+2 \quad +3 \quad +4 \quad +5 \quad +6 \quad +7$

b)  $2, 4, 8, 16, 32, \underline{64}, \underline{128}$   
 $\cdot 2 \quad \cdot 2 \quad \cdot 2 \quad \cdot 2 \quad \cdot 2 \quad \cdot 2$

c)  $100, 10, 1, .1, \underline{.01}, \underline{.001}$   
 $\div 10 \quad \div 10 \quad \div 10 \quad \div 10 \quad \div 10$

d)  $\sqrt[3]{3}, \sqrt[3]{9}, \sqrt[3]{27}, \underline{\sqrt[3]{81}}, \underline{\sqrt[3]{243}}$   
 $\frac{1}{3^1} \quad \frac{1}{3^2} \quad \frac{1}{3^3} \quad \frac{1}{3^4} \quad \frac{1}{3^5}$

## 2 Key pieces of info:

- 1) one equation  $\Rightarrow$  terms are denoted by subscript
- 2) can plug in & find any term #.

ex  $t_n = 3n + 2$   
     $t_{\text{sub } n}$

$$t_1 = 3(1) + 2 = 5$$

$$t_2 = 3(2) + 2 = 8$$

$$t_{10} = 3(10) + 2 = 32$$

$$t_{14} = 3(14) + 2 = 44$$
